

Kite's artefact lives where the atlas cannot look

Energy of the flank feature (state minus its $K \leq 32$ low-pass) by arclength ripple order, SC-041 kite M = 22 endpoint.

93%

of the feature's energy is above order 30, outside the atlas.

Yet its small low-order part moves the data by $1.3\text{--}2.1\times$ the remaining residual: the artefact absorbs misfit, which is why the fit keeps it.
